### **Guides to Install**

1. The HDMI2USB3    USB 3.0 dongle supports hot plug and swap. Connect the USB 3.0 cable head to the USB 3.0 interface of the dongle. The other end of the cable is connected to the USB 3.0 of the computer.
2. The USB 3.0 dongle is a device that supports PnP, which needs no driver. If the POWER and ACTION indicators are on, it means the dongle is working well.

Note: It is suggested that connect the USB 3.0 interface after the HDMI cable is connected well. The reason is because the HDMI video source is usually not stably grounded, and high voltage gap may exist between the HDMI grounding and computer grounding, which may cause the video source or dongle not to work properly.
